Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw., SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6
RP3-398A12 is from the library RPCI-3 constructed by the group of Pieter de Jong. For further details see

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.shanger.ac.uk/HGP/ChrX

RP3-326113 is from the library RPC1-3 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

On Aug 20, 2003 this sequence version replaced gi:14646819.
The orientation of the sequence is from M13rev to -21M13 of the BAC clone. The nucleotide sequence of this BAC clone was generated by combining Monsanto and RGP-Japan sequencing data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      148416 bp DNA

between OTICE: This sequence may not represent the entire insert of this lone. It may be shorter because we only sequence overlapping lone sections once, or longer because we provide a small overlap etween neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest. ĭ

MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping sequencing collaboration between the NHGRI Chromosome 7 Mapping Project and the Washington University Genome Sequencing Center. additional information about the map position of this sequence, http://www.nhgri.nih.gov/DIR/GTB/CHR7 or mailto:egreen@nhgri.nih.gov For and

Clone CTA-308B22 is from a release of the human BAC library CITB-HS-A. The library contains cloned DNA from human sperm. See: Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J. Shizuya et al., Genomics 34:213-8 (1996). The clone is available from the content of the content of the content of the content of the clone is available from the content of t Research Genetics, Inc. (http://www.resgen.com). VECTOR: pBeloBAC11 Selection: SOURCE INFORMATION: chloramphenicol

NEIGHBORING SEQUENCE INFORMATION:
Actual start of this clone is at base position 1 of CTA-308B22 actual end is at base position 148416 of CTA-308B22.

Quality coverage: 6.9 in Q20 base.
NOTE: This is a 'working draft' sequence. It currently
consists of 5 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence.

                 all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                   NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (18-DEC-2003) Department of Genetics, Washington University, 4444 Forset Park Avenue, St. Louis, Missouri 6: On Nov 19, 2003 this sequence version replaced gi:33386996

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu MAPPING INFORMATION:

SOURCE INFORMATION:

The RPCI-43 BAC Library has been constructed by Chung-Li Shu. DNA was isolated from white blood cells obtained from a male chimpanzee (Pan troglodytes, 'Clint', Yerkes #C0471; birthdate: 6-6-80). The clone and detailed information can be obtained from ResGen (http://www.resgen.com) or Pieter de Jong and co-workers at NEIGHBORING SEQUENCE INFORMATION: http://www.bacpac.chori.org of the clone

sequence is the entire insert

NOTE: This is a 'working draft' sequence. It currently consists of 70 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (bases 1 to 186184)

Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Nov 15, 2002 this sequence version replaced gi:23808767. The sequence in this assembly is a combination of BAC based reads
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (29-APR-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Williams,G., Willson,R., Wleczyk,R., Wooden,H., Worley,K., Wright,D., Wright,R., Wu,J., Yakub,S., Yen,J., Yoon,L., Yoon,V., Yu,F., Zhang,J., Zhou,J., Zhou,X., Zhao,S., Dunn,D., von Niederhausern,A., Weiss,R., Smith,D.R., Holt,R.A., Smith,H.O., Weinstock,G. and Gibbs,R.A.

```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap

```
between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren,
Department of Genetics, Washington University, St. Louis MO. For
additional information about the map position of this sequence, see http://genome.wustl.edu

SOURCE INFORMATION.

The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa and Minako Tateno in the laboratory of Pieter de Jong and Minako Tateno in the laboratory of Pieter de Jong (http://www.chori.org) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org

NEIGHBORING SEQUENCE INFORMATION:
This sequence is the entire insert of the clone ocation/Qualifiers

                                                                                                                                                                                                                                                                       Human ovarian cancer related cDNA clone SEQ ID NO:7544.
                                                                                                                                                                                                                                                                                                                            ABL84566;
                                                                                                                                                                                                                                                                                                                                                     ABL84566 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for potentiating or enhancing the toxic effect of a cytoboxin or oxidising agent on a cancer cell, comprising contacting the cell with an oligonucleotide complementary to gene involved in transcription coupled repair (TCR) and nucleotide excision repair (NER) and with a cytotoxin or oxidising agent. The invention is used to sensitise cancer cells to therapeutic agents. The present sequence is an antisense oligonucleotide directed against Xeroderma pigmentosum group A (XPA) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing sensitivity of cancer cells to a cytotoxin or oxidizing agent useful for therapy comprises contacting them with oligonucleotides complementary to transcription coupled repair or nucleotide excision

cf from the 19912 nucleotide sequences as given in ABL77023 to ABL87934,
cc (III) encoding (II) having a sequence (S2), a T cell population of (II),
cc or antigen presenting cells that express (II). (I) has cytostatic
cc activity. An oligonucleotide (IV) that hybridises to (S1) can be used for
cd detecting ovarian cancer in a patient's biological sample preferably
cs erum or ovarian tissue. The method comprises contacting a biological
cc sample from a patient with (IV), detecting the amount of polynucleotide
cc hybridising to (IV) and comparing the amount to a predetermined cutoff
cv value and thereby detecting ovarian cancer in the patient, where the
camount of polynucleotide hybridising to (IV) is detected preferably by
cc polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is
cuseful for stimulating and/or expanding T cells with (III) or (II). (III) is
cuseful in design and preparation of ribozyme molecules for inhibiting
ce expression of the tumour polypeptides and proteins in tumour cells; and
co library usign well length gene from a suitable library e.g., a tumour cDNA
                                                            Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABL79139 standard; cDNA; 506

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
```

The present invention describes a composition

(I) comprising: carriers

immunostimulants; and a polypeptide (II) of a ovarian

tumour

(S1)

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC polypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1) (III) having a cDNA sequence (S1) (III) having a cDNA sequence (S2), a T cell population of (II), CC or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for CC detecting ovarian cancer in a patient's biological sample preferably CC serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide (CC hybridising to (IV) and comparing the amount to a predetermined cutoff CC value and thereby detecting ovarian cancer in the patient, where the CC amount of polynucleotide hybridising to (IV) is detected preferably by colymerase chain reaction (PCR). (I) comprising (III) and/or (II) is CC cuseful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells specific for (III) is CC useful in design and preparation of ribozyme molecules for inhibiting CC useful in design and preparation of ribozyme molecules for inhibiting account of isolate a full length gene from a suitable library e.g., a tumour cDNA cCC library using well known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Sequences AAS63224-AAS63305 represent cDNA encoding and PCR primers used to amplify cDNA encoding proteins which can be used in the synthesis of chimeric proteins comprising a DNA mutation-binding protein, a linker at a nuclease, by recombinant technology. The chimeric proteins are useful a nuclease, by recombinant technology. The chimeric proteins are useful for detection, quantification and mapping of DNA sequence variations for detection, quantification and mapping of DNA sequence variations

PCR primers used

and

mutations,

Recombinant chimeric protein, useful for detecting and quantifying DNA mutations, e.g. in disease diagnosis, comprises mutation-binding prote

protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for a novarian tumour protein comprising contacting T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (II) (III) is useful in design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour cDNA library using well known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               XPC;

                                                                               The present invention relates to a method for potentiating or enhancing the toxic effect of a cytotoxin or oxidising agent on a cancer cell, comprising contacting the cell with an oligonucleotide complementary to gene involved in transcription coupled repair (TCR) and nucleotide excision repair (NER) and with a cytotoxin or oxidising agent. The invention is used to sensitise cancer cells to therapeutic agents. The present sequence is a human Xeroderma pigmentosum group A (XPA) gene located on chromosome 9
                                                                                                                                                                                                                                             Increasing sensitivity of cancer cells to a cytotoxin or oxidizing agent useful for therapy comprises contacting them with oligonucleotides complementary to transcription coupled repair or nucleotide excision
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins are able to bind to the site of the DNA mutation and cut it out of the molecule. This is useful for early diagnosts of cancer and other diseases. The proteins used in the invention include human XPF (or ERCC4), human xeroderma pigmentosum complementation groups A, C and E (XPA, XPC and XPE), human Muts homologue 2 (hMSH2), Serratia marcescens nuclease (Nuc), Thermus thermophilus Muts, Escherichia coli Fapy-DNA glycosylase (FDG), uracil DNA glycosylase (Mut), synthetic T4 endonuclease V (T4 endo V), thymine DNA glycosylase (Mut), synthetic T4 endonuclease V (T4 endo V), thymine DNA glycosylase (TDG), E. coli Uvr A, B and C, and E. coli endonucleases and

The sequences of the invention care useful in the diagnosis, treatment, prevention and/or prognosis of cd disorders involving neoplastic disease such as hyperproliferative cd disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem cd disorders, adult liver cancer, childhood cerebellar astrocytoma, or choloma, adult liver cancer, childhood cerebellar astrocytoma, or complete the complete

                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to one of 238 disclosed human neoplastic disease-
CC associated polypeptides encoded by 171 disclosed cDNA sequences
CC (including their domains, epitopes, full-length proteins, allelic variants
CC or species homologues). Also included are there encoding nucleic acids, a
CC recombinant vector comprising the nucleic acid, a recombinant host cell
CC comprising the nucleic acid (expressing the protein), an isolated
CC antibody that binds specifically to the isolated polypeptide, preventing,
CC treating or ameliorating a medical condition, diagnosing a pathological
CC condition or a susceptibility to a pathological condition in a subject,
CC identifying a binding partner to the polypeptide, identifying an activity
CC in a biological assay, and the gene corresponding to the CDNA sequence.
CC detecting, preventing, diagnosing, prognosticating, treating or
CC ameliorating medical conditions such as hyperproliferative diseases or
CC cancer, autoimmune disorders (e.g. diabetes, rheumatoid arthritis,
CC systemic lupus erythematosus, multiple sclerosis, autoimmune thyroiditis
CC systemic lupus crythematosus, multiple sclerosis, autoimmune thyroiditis
CC anaemia or thrombocytopaenia), allergic reactions including asthma or
CC eczema, inflammatory disorders (e.g. ischaemia-reperfusion injury,
                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                               CC identity to any of the 2469 amino acid sequences, identitied in the compressed from 2469 of 2489 identified DNA coding regions from the CC expressed from 2469 of 2489 identified DNA coding regions from the CC Streptcococcus pneumoniae type 4 strain genomic sequence appearing as CC treating a patient by administering the protein, DNA or antibody (in a CC composition), a kit comprising first and second primers, which are the cc nucleic acid cited above or fragments between nucleotides 8-100 of a Sequence contained within a Streptcoccus nucleic acid sequence, where the first primer is substantially complementary to the target sequence contained within a Streptcoccus nucleic acid sequence, where the first primer is substantially complementary to the target sequence contained where the parts of the primers having contacting a test compound with the protein, and determining whether the test compound with the protein, and determining contacting a test compound with the cacid as treptcocccus pneumoniae bacterium, where one or more genes contacting the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptcocccus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis medica or ear infection. They are also useful in developing vaccines, and antibotics. The methods are useful for identifying cidentified coding region from the genomic sequence. Note: The sequence cod data for this patent did not form part of the printed specification, but the part of the printed specification, but standardise of signal part of the printed specification, but standardise of signal parts of the printed specification, but standardise of signal parts of the printed specification, but standardise of signal parts of the printed specification, but the sequence of standardise of signal parts of the printed specification and compositions are useful for identifying the sequence of standardise of s

                                                                                                                                                                                                                                                                                Fannon M;
```

The present invention describes a computer readable medium which has the CC nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524) recorded CC on it, or a representative fragment or a sequence at least 95% identical CC to SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 CC pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a CC grobe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that CC hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced from an CC organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified compositions of ithe S. pneumoniae genome. Products from the S. pneumoniae genome of cc membercial importance, or expression modulating fragments of the S. pneumoniae should assays, and pharmaceutical compositions and vaccines cf for S. pneumoniae, and assays, and pharmaceutical compositions and vaccines cf. S. pneumoniae

```

```
Sireptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarily define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the protein protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptococcus pneumoniae type 4 strain complete genome
                                                                                                                                                                                                                                                                                                                                                                                                                            New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media of the streptococcus bacteria, such as pneumonia, sepsis, otitis media of the streptococcus bacteria, such as pneumonia, sepsis, otitis media of the streptococcus bacteria, such as pneumonia, sepsis, otitis media of the streptococcus pneumoniae,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Streptococcus pneumoniae; type 4 strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-OCT-2003
                                                                                                                                                                                                                                                                                      The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-MAR-2002; 2002WO-IB002163
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABS56454

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otiti media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is the Streptococcus pneumoniae type 4 strain genome sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to an isolated nucleic acid comprising: contiguous nucleotide positions 1-15246 of a sequence comprising 15246 bg fully defined in the specification; a nucleotide sequence complementary to the 15246bp sequence; or a Cryptovirus-specific fragment of the 15246bp or its complement, at least about 5 nucleotides long. The nucleic acid is useful in diagnosing and treating many idiopathic neurological; neurodegenerative, neuropsychological and neuropsychiatric disorders, including epileptiform diseases (e.g. epilepsy, multiple sclerosis, chronic fatigue syndrome or subacute sclerosing panencephalitis) and primary lymphadenopathy-associated illnesses, and in research and development, including screening of potential new antiviral drugs. The nucleic acid, protein and the viral particle are useful in manufacturing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ક
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 14
The invention relates to an isolated nucleic acid comprising: contiguous uncleotide positions 1-15246 of a sequence comprising 15246 bg fully defined in the specification; a nucleotide sequence complementary to the 15246bp sequence; or a Cryptovirus-specific fragment of the 15246bp or its complement, at least about 5 nucleotides long. The nucleic acid is useful in diagnosing and treating many idiopathic neurological, neurodegenerative, neuropsychological and neuropsychiatric disorders, including epileptiform diseases (e.g. epilepsy, multiple sclerosis, chronic fatigue syndrome or subacute sclerosing panencephalitis) and primary lymphadenopathy-associated illnesses, and in research and development, including screening of potential new antiviral drugs. The nucleic acid, protein and the viral particle are useful in manufacturing a vaccine. The protein is also used in producing a Cryptovirus-specific antibody. The antibody may also be used in manufacturing a medicament for the treatment of Cryptovirus infections. The polynucleotides of the invention can be used to treat disorders by gene therapy. This
